1 Introduction

1.1 Cellular Processes

1.1.1 The Cytoskeleton

1.1.2 Mitosis

1.2 Motor Proteins

1.3 Dynein

1.3.1 Directed Motion

1.3.2 Drunken Walking

1.3.3 Transporting Cargo

1.3.4 Experimental Stepping Statistics

2 The Model

2.1 Brownian Motion

2.2 A Simplified Model for Dynein

2.3 Equations of Motion

2.3.1 The one bound state

2.3.2 The both bound state

2.3.3 Calculating Forces and Torques

2.4 The Code

3 Results

3.1 Model Tests

3.1.1 Determining an Appropriate Δt

3.1.2 Conservation of Energy

3.2 Parameter Fitting

3.3 Model Stepping Statistics

3.4 Simulating External Forces

4 Discussion

4.1 Comparison to Experimental Results

4.2 Consequences of the Simple Model

4.2.1 Do we need a Two State Model?

5 Conclusions

5.1 Summary

5.2 Future Work

5.2.1 Multiple Dynein
